

Assignment 4 Ryan Lebeau 104535367

1. If the Manager use case had one more feature than the sequence diagram then the feature would be inserted into the diagram within the proper space if and only if the feature is a key feature. Alternatively, if the Manager use case had one more feature than the requirement does the diagram would have to be reworked within the feature to accommodate this sector.
2. Generalization relationships between classes can not be illustrated in a sequence diagram since the relationship is started by an actor (the manager) and the generalization is between classes solely and the child is not set by the parent.
- 3.

4. a.

b.
